Magic Constants

Here are the magic constants, with descriptions and examples:

Constant	Description
<code>__CLASS__</code>	If used inside a class, the class name is returned.
<code>__DIR__</code>	The directory of the file. If used inside an include, the directory of the included file is returned. This is equivalent to <code>dirname(__FILE__)</code> . This directory name does not have a trailing slash unless it is the root directory.
<code>__FILE__</code>	The full path and filename of the file. If used inside an include, the name of the included file is returned.
<code>__FUNCTION__</code>	The function name. (Added in PHP 4.3.0) As of PHP 5 this constant returns the function name as it was declared (case-sensitive). In PHP 4 its value is always lowercased.
<code>__LINE__</code>	The current line number of the file.
<code>__METHOD__</code>	The class method name.
<code>__NAMESPACE__</code>	The name of the current namespace. (Added in PHP 5.3.0)

PHP 1 MagicConstant CLASS

```
<h2>phpMagicConstant __CLASS__ </h2>
<p>If used inside a class, the class name is returned </p>
```

```
<?php
class Fruits
{
    public function myValue()
    {
        return __CLASS__;
    }
}
$kiwi = new Fruits();
echo $kiwi->myValue();
?>
```

phpMagicConstant __CLASS__
